Project Abstract Submission Form

Sec No-	Team No-	Project Title- Enterprise Parcel Management System for Courier & Parcel

1. Abstract

The Enterprise Parcel Management System for Courier & Parcel is a database management system designed to efficiently manage courier and parcel operations. Traditional parcel management methods often involve manual records, which can lead to data duplication, misplaced information, tracking difficulties, and delays in updating parcel status. This system provides a centralized database to store and manage information related to customers, parcels, courier services, delivery agents, locations, payments, and delivery status.

The system allows users to register parcels, maintain customer details, assign delivery agents, track parcel movement, and update delivery statuses in real time. The database maintains relationships between different entities to ensure data accuracy, consistency, and easy retrieval. SQL queries can be used to perform operations such as adding new parcels, searching shipment details, updating delivery status, generating delivery reports, and managing customer records.

The proposed system reduces manual effort, improves parcel tracking, minimizes data redundancy, and provides faster access to important information. Overall, the Enterprise Parcel Management System offers a structured, reliable, and scalable database solution for managing courier and parcel services efficiently.
